Sales Performance Analysis & Dashboard

Excel case study | 1,000 orders | January to December 2025

Rs 12.2 Cr	1,000	Rs 1.22 Lakh	10,659
Total net sales	Orders	Average order value	Units sold

Business question

Where does revenue come from, and where is it slipping? Which products, regions, months and salespeople drive results, and how much do discounts cost?

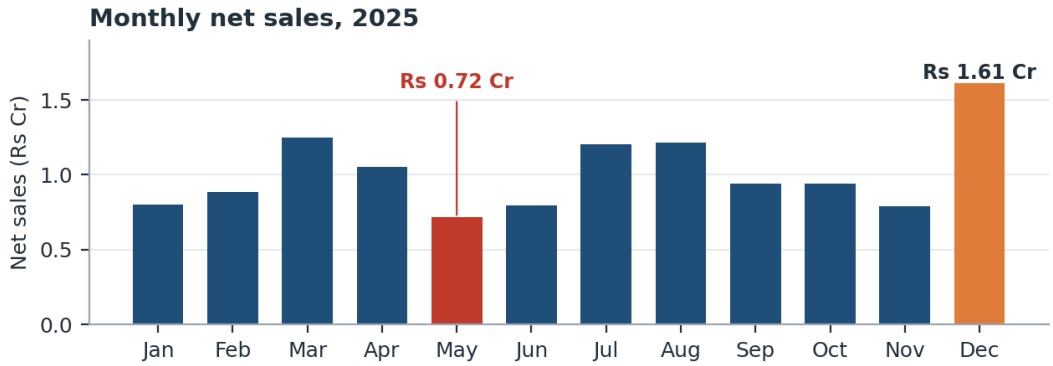

What I did

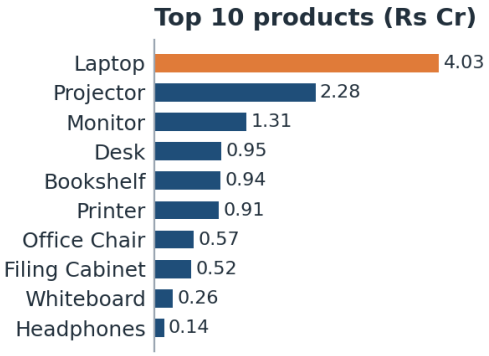

- **Cleaned the raw data first.** Found and fixed duplicates, misspellings, missing values, invalid numbers and out-of-period dates (full list on page 3).
- **Calculated the key measures with Excel formulas:** gross sales (quantity x unit price), net sales (after discount), discount impact and average order value.
- **Built Pivot Tables and charts**, then combined them into a one-page management dashboard (page 2).

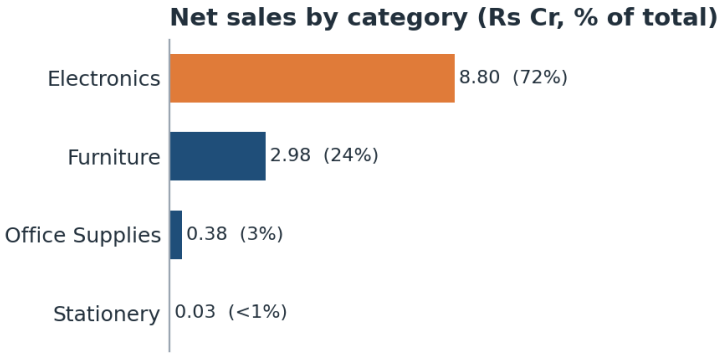

Headline findings

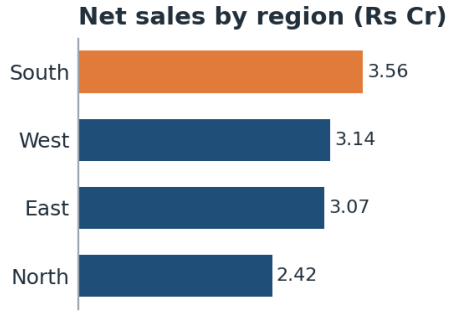

- **Electronics drives about 72%** of net sales, and **Laptop alone is 33%** (Rs 4.03 Cr). Laptop and Projector together are about 52%.
- **December is the peak month** at Rs 1.61 Cr, more than double May, the weakest month (Rs 0.72 Cr).
- **South is the top region** at Rs 3.56 Cr (about 29% of sales); North is the lowest of the four named regions at Rs 2.42 Cr.
- **Discounts cost Rs 1.13 Cr**, about 8.5% of gross sales. 999 of 1,000 orders carry a 0-15% discount; one 50% discount is flagged as an outlier.

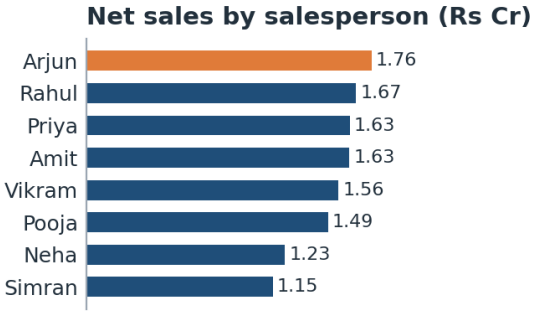

Sales dashboard

Charts rebuilt from the cleaned dataset used in the Excel dashboard. Values in Rs Crore (1 Cr = 10 million). Orange bars mark the leader in each chart; the red bar marks the weakest month. The 4 regions exclude Rs 11,400 of sales with an unknown region.

Key insights

1. **Sales are concentrated in a few products.** Laptop (33%) and Projector (19%) together make up about 52% of net sales; the remaining 13 products share the other half.
2. **Electronics leads everywhere.** It is the top category in every region and every month, at about 72% of sales. Furniture adds about 24%; Office Supplies and Stationery together are about 3%.
3. **Laptop is the top product in all four named regions.** Regional sales are fairly balanced: South 29%, West 26%, East 25%, North 20%.
4. **Sales are seasonal.** December (Rs 1.61 Cr) and March (Rs 1.25 Cr) are the strongest months; May (Rs 0.72 Cr) is the weakest.
5. **Salesperson results are fairly even.** Arjun leads at Rs 1.76 Cr and Simran is lowest at Rs 1.15 Cr.
6. **Discounts reduce gross sales by about 8.5%** (Rs 1.13 Cr of Rs 13.33 Cr). Discount levels of 0%, 5%, 8%, 10%, 12% and 15% are spread evenly across orders.

Questions I would investigate next

- What drove the December and March peaks (promotions, seasonality, large orders), and how can the May low be improved?
- Do higher discounts actually produce larger orders, or do they only reduce revenue?
- Why does North trail the other regions, and is it product mix or order volume?

Data cleaning log

Issue	What I did
Duplicate Order ID 1074 (a different transaction)	Renumbered the second record to 1075 to keep IDs unique
Misspelled values ("officechair", "lapotp", "Noth", "Electronics")	Standardized to Office Chair, Laptop, North and Electronics
Missing Region and Salesperson	Labeled "unknown" instead of guessing
Missing Quantity (Order 1375) and negative Quantity (Order 1900)	Left blank, so they are excluded from net sales
Zero unit price (Order 1450, a Keyboard)	Replaced with the Keyboard price of Rs 1,200
Missing Order ID	Filled with 1980 to keep the sequence
Orders dated outside 2025 (Order 1950 in 2024, Order 1600 in 2026)	Flagged and kept; together under 0.1% of net sales
50% discount (Order 1525)	Flagged as an outlier and kept

Tools: Excel (Pivot Tables, Formulas, Charts, Data Cleaning, Dashboard Design)
